

AI assistant for sellers to fix dead products and boost conversions

For each product, Souma explains what shoppers engage with, what blocks sales, and what to change in title, image, and front-page placement.

Main user

Seller / store operator

Main output

Actionable product recommendations

Main impact

Higher product-level conversion rate

CORE PROBLEM

Sellers see traffic, but they do not know why specific products do not sell

- They cannot tell which product specs buyers care about most.
- They cannot detect friction quickly (payment issues, trust issues, weak listing).
- They do not know what to promote in title, hero image, or homepage placements.

One seller page that turns engagement signals into concrete actions

Per-product insight

- Most engaged specs or sections
- Most viewed variants (color/size/spec)
- Review-tab intensity and quality concern signals

Per-product recommendations

- What to move to title and first image
- What to place on homepage cards
- What issue to fix first (payment, trust, content, pricing)

HOW IT WORKS

Behavioral telemetry + diagnosis logic + assistant recommendations

Layer	Data captured	Decision produced
Engagement tracking	Clicks, product visits, tab focus, scroll depth, variant interactions	Top attention hotspots by product
Friction detection	Checkout drop-offs, payment failures, repeat review checks, bounce patterns	Likely reason product is underperforming
Seller assistant	Product context + engagement deltas + conversion gaps	Prioritized listing and merchandising actions

What a seller sees for a weak product

Detected signals

- High review-tab opens before exit
- Most clicks on “battery life” spec
- Black color gets 2.3x more interactions

Recommended actions

- Move battery life to title and first image text
- Add quality proof near price and CTA
- Feature black variant on homepage placement

WHY THIS WINS

Not just analytics, but seller decisions at product granularity

- Traditional dashboards show numbers; Souma explains why and what to do next.
- Recommendations are tied directly to listing assets sellers can edit fast.
- Feedback loop improves as more engagement data accumulates per product type.

Build the best AI copilot for regional sellers

Phase 1

Reliable telemetry, seller page MVP, top-3 recommendations per product.

Phase 2

Root-cause confidence scoring and automated A/B suggestion generation.

Phase 3

Multi-store benchmark intelligence and self-optimizing merchandising.

Funding focus: product intelligence, model quality, and merchant adoption channels.
